

## Parsec Labs helps Ovation Data reduce migration time by half for project completion ahead of schedule

### Situation

Ovation's client was seeking to migrate seismic data off its own network for long-term physical and digital preservation. Its existing data infrastructure was aging, and the annual maintenance fees were costly.

Migrating and properly archiving the enterprise's data would ensure its long-term integrity and accessibility. It would also reduce the in-house physical and digital footprint, and lower overhead costs as a result.

#### About Ovation Data

IT service management & hosting company based in Houston that serves companies in the oil & gas and entertainment industries

### Challenges

Ovation's client had 3 petabytes of data that needed to be moved in less than three months, and the security team required that all data be encrypted "in flight."

### Solution

Ovation deployed two Parsec Data Management Appliances – one at the client site and the other in Ovation's data center. Installation, setup and initial job creation took less than a day.

From there, the migration proceeded rapidly, and Parsec's encryption ensured all data was secure as it was being transferred. Start to finish, the migration of 3 petabytes was completed in about six weeks, well within the three months allocated for the project.
